

# Strengthening The Monitoring System for Tigers

Y. V. Jhala

Head, Animal Ecology & Conservation  
Biology

&

Q. Qureshi

Sr. Scientist

Landscape Planning & Management

Wildlife Institute of India

A Report on the  
Project Tiger Directorate  
Initiative  
“Tiger Habitat & Population  
Evaluation System”  
in collaboration with  
Wildlife Institute of India  
&  
Forest Department of Madhya  
Pradesh

# Importance of Tiger Conservation

**Charismatic Large Carnivore at the Apex of the Food Chain**

**Acts as an umbrella species for conserving the biodiversity of forested ecosystems**

# Questions Relevant for Tiger Conservation

---

-  **State of tiger habitat?**
-  **Population Trend of Tigers?**
-  **Areas where Tigers are decreasing & why ?**
-  **What is the status of tiger's wild prey?**
-  **Where are the Source Populations (breeding units) ?**
-  **Spacing & connectivity of Populations?**
-  **How many tigers ?**

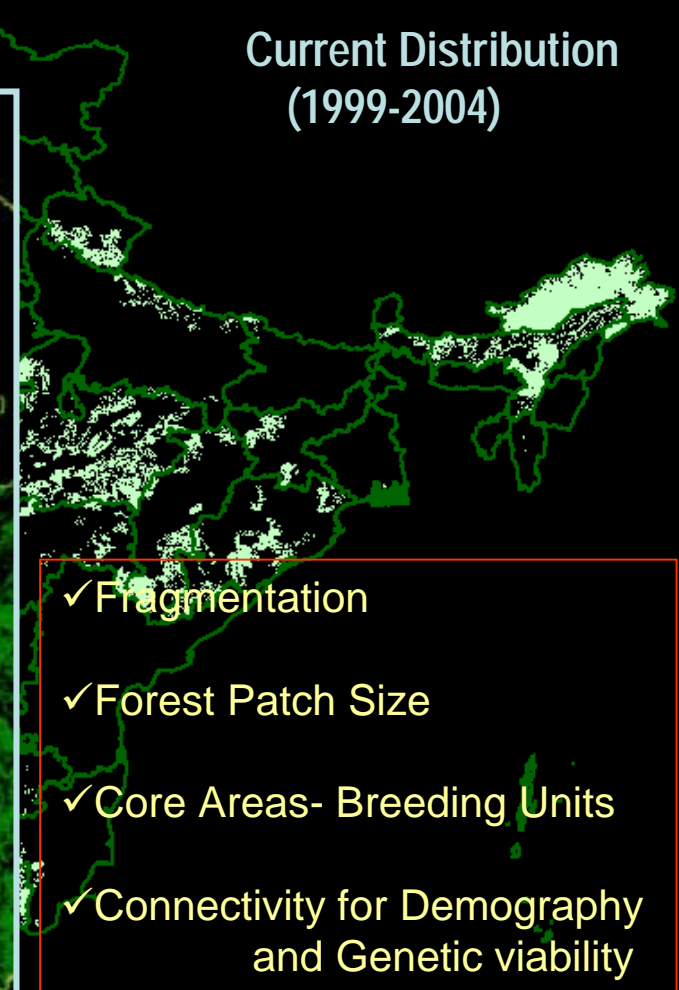

# Change in Tiger Distribution

## Historical Distribution

Reports from 19<sup>th</sup>-10<sup>th</sup> Century

## Current Distribution (1999-2004)

# Current Methodology: The Pugmark Census

- 🐾 Followed since 1970, All India Census every 4 years, PT Areas every year.
- 🐾 Obtain Pugmark Tracings, Plaster Casts and Gait measurements
- 🐾 Ancillary information on location, date, and substrate
- 🐾 Identify individual tigers on the above information
- 🐾 Continuously monitor individual tigers over time
- 🐾 Arrive at a total count in an area

# Critique of the Pugmark Census Method

- 🐾 Attempts total count of Tigers.
- 🐾 Based on Enumerators Subjective Ability to Identify Individual Tigers from Pugmarks.
- 🐾 Variation in Pugmarks with substratum, gait, and observers recording skills.
- 🐾 Not possible to obtain Pugmarks from all Tiger Occupied Landscapes.

# Comparing Pugmark Census Total Counts with Population Estimates from Camera Traps

# Correlating Tiger Population with Tiger Sighting Frequency by Forest Staff

## Bandhavgarh

## Panna

# Correlating Tiger Population with Tiger Sighting Frequency by Forest Staff

## Kanha

## Pench

# Correlating Tiger Population with Tiger Sighting Frequency by Forest Staff

## Sariska Tiger Reserve

$r = 0.6$ ,  $P = 0.115$

## Indravati Tiger Reserve

$r = 0.075$ ,  $P = 0.88$

# Correlating Tiger Population with Tiger Sighting Frequency by Forest Staff

Reported Tiger Population

Sighting Frequency by Staff

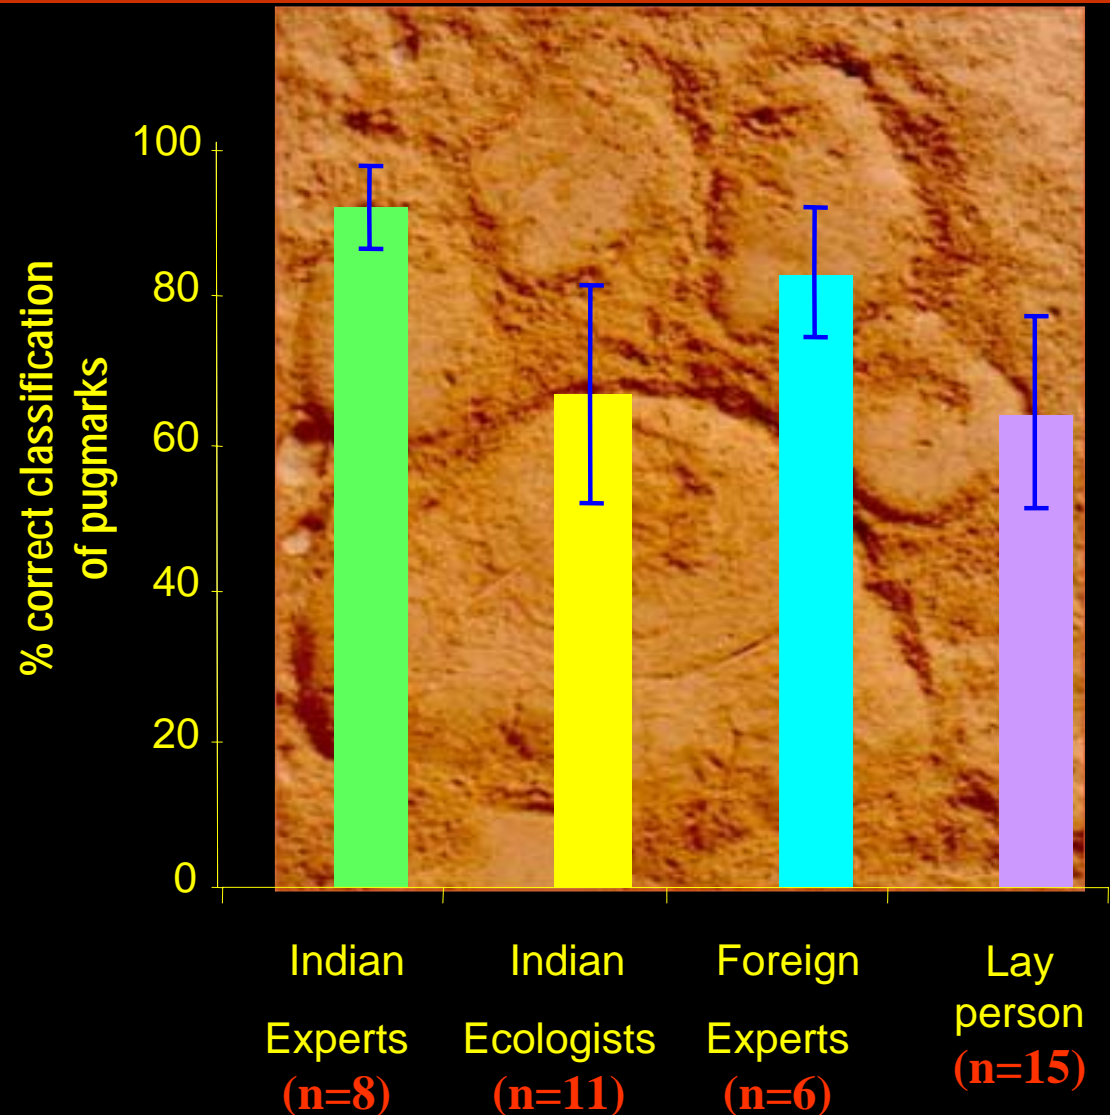

# Reliability of Subjective Identification of Pugmarks to Individual Tigers

Estimating the correct number of Tigers represented by 14 Pugmark Tracings from 7 different Tigers.

# Removing Subjectivity

1. Area of Toe 3
2. Length Toe 3
3. Pug width
4. Distance for T2 to T3
5. Angle between T2 & T3
6. Distance between N1 & N2
7. Length T2
8. Heel to toe length
9. Distance of pad to toe base
10. Stride
11. Straddle

Discriminant Function Analysis for Pugmarks  
of 18 Different Tigers

# Addressing Possible Sources of Variation

 **Stage I** - Systematic Distribution of Sampling Units Throughout Tiger Landscapes for Spatial Occupancy Monitoring as opposed to Total Count.

 Beat level (10-15 km<sup>2</sup>) spatial resolution of :

- *Tigers & Other Carnivore (sign indices)*
- *Ungulates (encounter rates & dung / pellet densities)*
- *Habitat Details & Human Disturbance*
- *Capacity building & Training of Forest Staff*

 Simple yet Scientifically Robust Methodology Across Landscapes.

 Appropriate Audit Mechanism by External, National & International Experts.

 Tested the logistics for this data collection Protocols within the Satpura-Maikal Landscape, Madhya Pradesh.

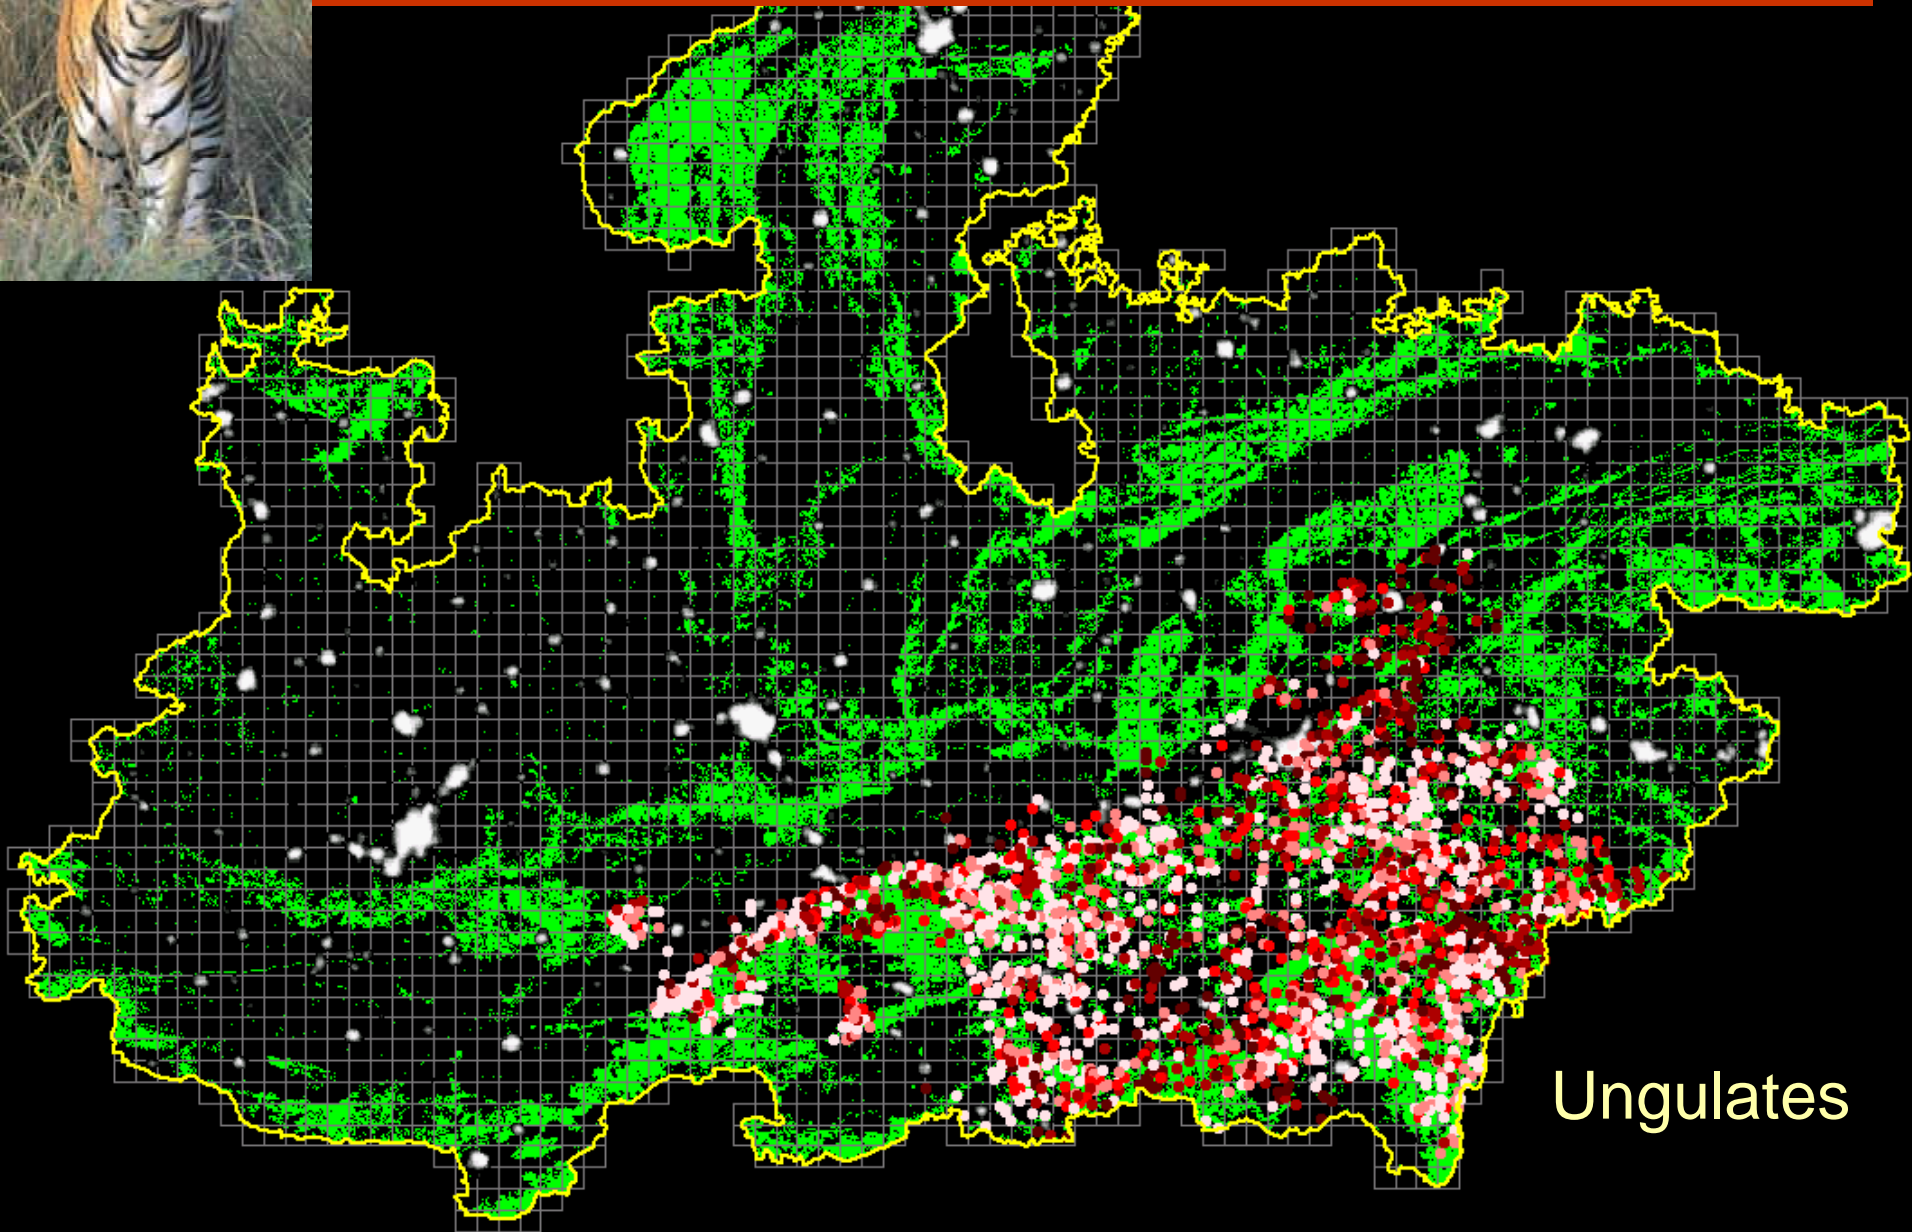

# Enhanced Methodology: Spatial Monitoring of Tiger, Prey & Habitat

$\approx 48,000$  km<sup>2</sup> sampled

# Spatial Monitoring of Tiger, Prey & Habitat

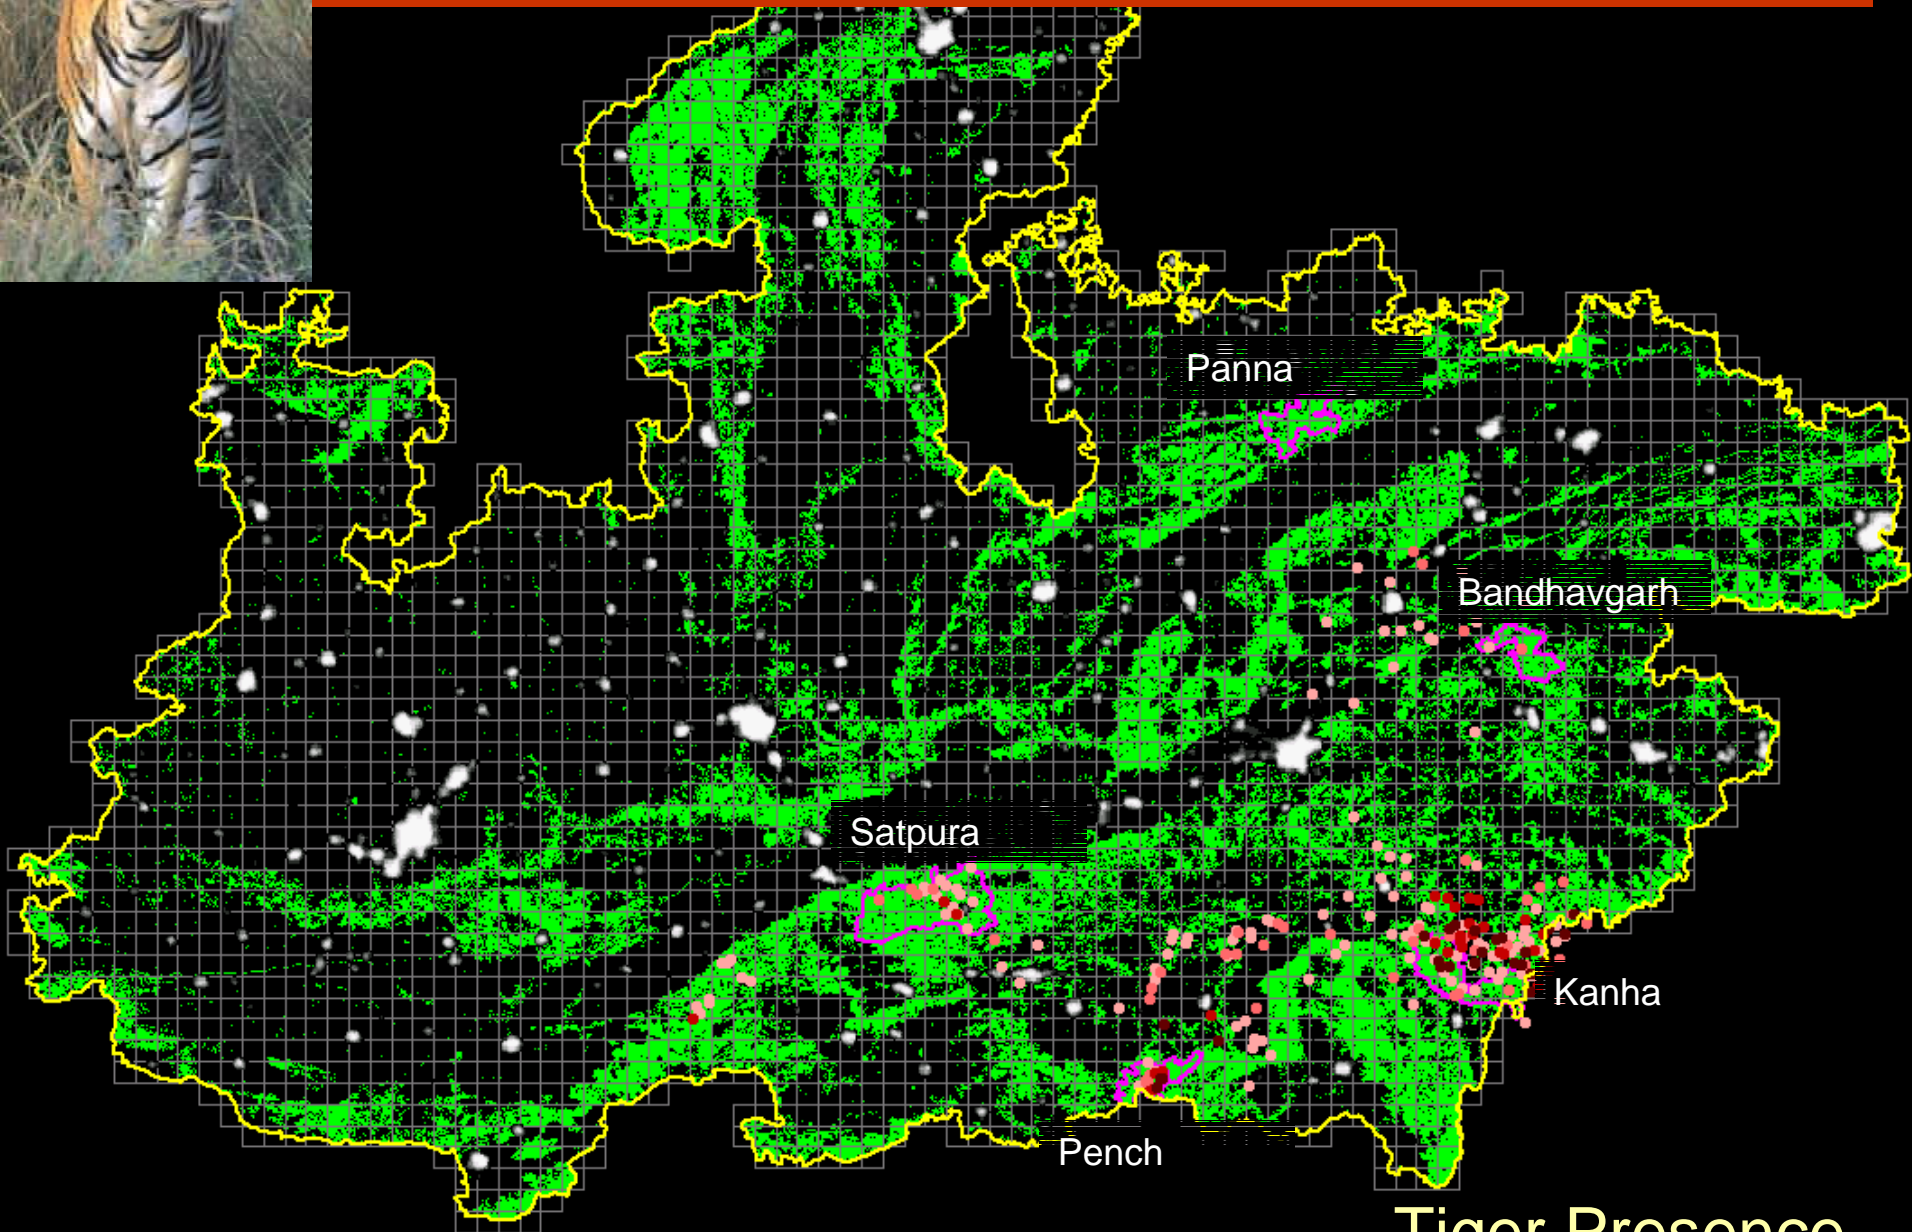

Ungulates

≈48,000 km<sup>2</sup> sampled

# Spatial Monitoring of Tiger, Prey & Habitat

~48,000 km<sup>2</sup> sampled

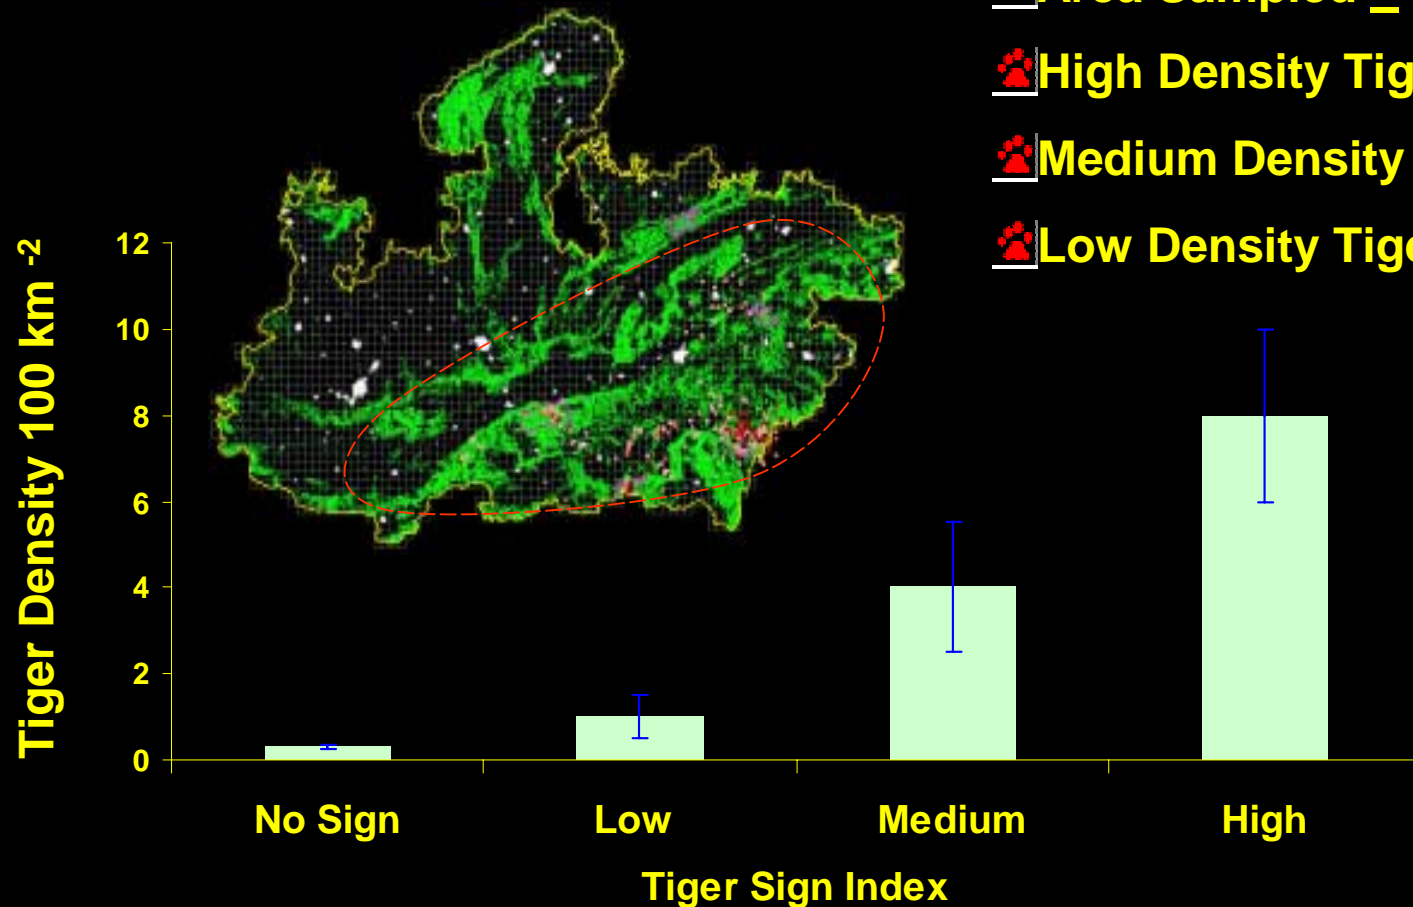

Tiger Presence

# Spatial Monitoring of Tiger, Prey & Habitat

**Stage II** – Intensive stratified Sampling  
for Tiger Density Estimation (Currently  
Ongoing, preliminary data)

-  **Area Sampled  $\approx 48,000 \text{ km}^2$**
-  **High Density Tigers  $\approx 1,800 \text{ km}^2$**
-  **Medium Density Tigers  $\approx 1,000 \text{ km}^2$**
-  **Low Density Tigers  $\approx 2,200 \text{ km}^2$**

Preliminary Data Suggests Tiger Population in the Satpura-Maikal  
Landscape Ranges between 239-392 (315)

# Monitoring Tiger Demography & Dispersal

## Using Modern Technological Tools of VHF/GPS/Satellite Tracking

 Dispersal

 Source / Sink Concept

 Meta Population

 Basic Ecology

➤ - Ranging Patterns,

➤ - Predation Ecology,

➤ - Recruitment,

➤ - Behaviour.

# Conservation at Work Chilla Range in Rajaji National Park

 Removal of Anthropogenic Pressures

 Tigers recolonise and breed within 1 year

Thank You !
